# ECE 6775 High-Level Digital Design Automation Fall 2023

## **Control Flow Graph**

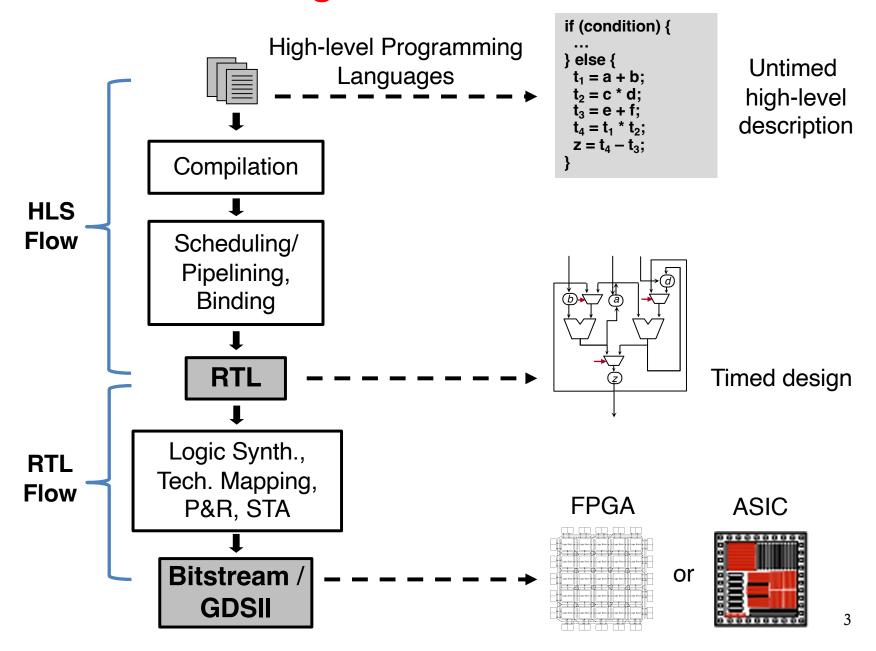

## **Announcements**

- Lab 2 will be released today
- HW 1 due tomorrow

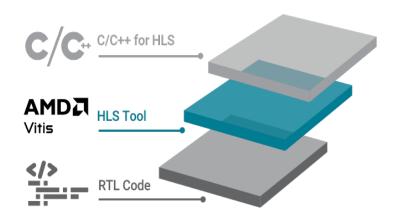

## **Agenda**

- A typical HLS compilation flow
  - Front-end compilation and intermediate representation
- Basics of control data flow graph
  - Basic blocks
  - Control flow graph
- Dominance relation
  - Finding loops

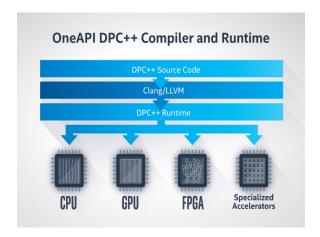

## **Accelerator Design Flow with HLS**

## **HLS for FPGAs: Entering the Mainstream**

Press Releases Date: 08/07/2018

- Achronix and Mentor Partner to Provide Link Between High-Level Synthesis and FPGA
- Achronix Speedcore eFPGAs fully supported by Catapult HLS

HLS-based design entry is available from all leading FPGA vendors

## **HLS Adoption for ASIC Design**

CHIPS

## Why YouTube decided to make its own video chip

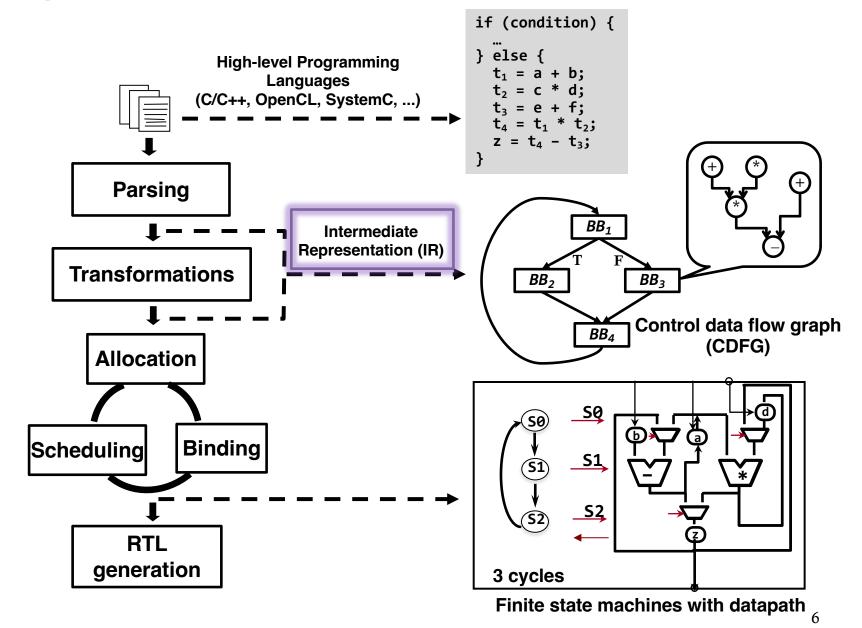

With YouTube designing its own custom chips, the company joins a growing group of big tech companies seeking to offer something unique in the data center. Operating behind the scenes, Argos made YouTube's data centers much more efficient.

YouTube Argos chip, or video-coding unit (VCU)

"... Argos is a piece of hardware defined by software, which meant that the engineers working on the chip could use what are called high-level synthesis techniques to iterate on the design much more quickly. Google developed its own version of high-level synthesis software called Taffel that it used to help make the TPUs and the Argos processors ..."

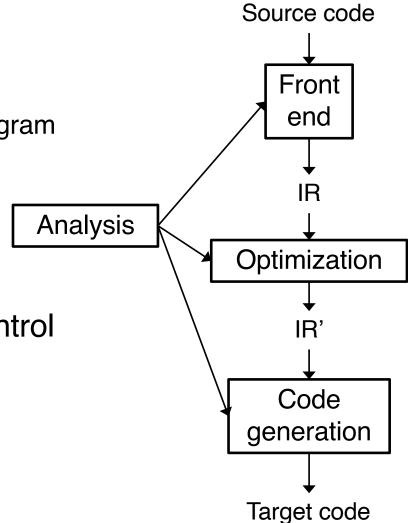

## **A Typical HLS Flow**

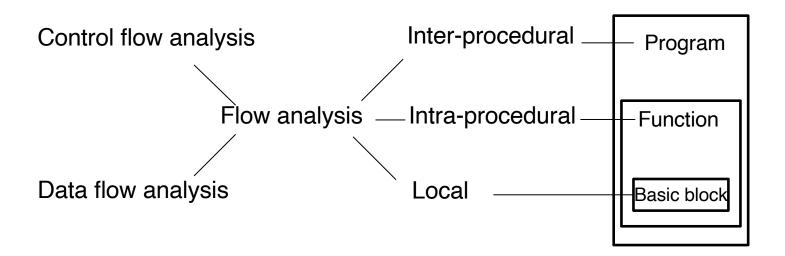

## **Intermediate Representation (IR)**

- Purposes of creating and operating on an IR
  - Encode the behavior of the program
  - Facilitate analysis
  - Facilitate optimization
  - Facilitate retargeting

 The IR we will focus on is control data flow graph (CDFG)

## **Program Flow Analysis**

- Control flow analysis: determine control structure of a program and build control flow graphs (CFGs)
- Data flow analysis: determine the flow of data values and build data flow graphs (DFGs)

#### **Basic Blocks**

- ▶ Basic block: a sequence of consecutive intermediate language statements in which flow of control can only enter at the beginning and leave at the end
  - Only the last statement of a basic block can be a branch statement and only the first statement of a basic block can be a target of a branch

## Partitioning a Program into Basic Blocks

- Each basic block begins with a leader statement
- Identify leader statements (i.e., the first statements of basic blocks) by using the following rules:
  - (i) The first statement in the program is a leader
  - (ii) Any statement that is the target of a branch statement is a leader (for most intermediate languages these are statements with an associated label)
  - (iii) Any statement that immediately follows a branch or return statement is a leader

## **Example: Forming the Basic Blocks**

(1) 
$$p = 0$$

(2) 
$$i = 1$$

(3) 
$$t1 = 4 * i$$

(4) 
$$t2 = a[t1]$$

(5) 
$$t3 = 4 * i$$

(6) 
$$t4 = b[t3]$$

$$(7)$$
  $t5 = t2 * t4$ 

(8) 
$$t6 = p + t5$$

(9) 
$$p = t6$$

$$(10) t7 = i + 1$$

$$(11) i = t7$$

$$(12)$$
 if i <= 20 goto  $(3)$ 

$$(13) j = ...$$

#### Leader statement is:

- (1) the first in the program
- (2) any that is the target of a branch
- (3) any that immediately follows a branch

#### **Basic Blocks:**

B1 (1) 
$$p = 0$$
 (2)  $i = 1$ 

(4) 
$$t2 = a[t1]$$

(5) 
$$t3 = 4 * i$$

(6) 
$$t4 = b[t3]$$

(7) 
$$t5 = t2 * t4$$

(8) 
$$t6 = p + t5$$

(9) 
$$p = t6$$

$$(10) t7 = i + 1$$

$$(11) i = t7$$

$$(12)$$
 if i <= 20 goto  $(3)$ 

#### Exercise: Basic Blocks and CFG

## Partition the given program into basic blocks

- (2) if (i >= N) goto (7)
- (3) if (i <= 0) goto (5) (4) A[i-1] = i

- goto (2)
- return

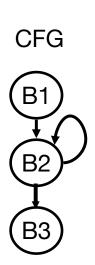

Leader statement is:

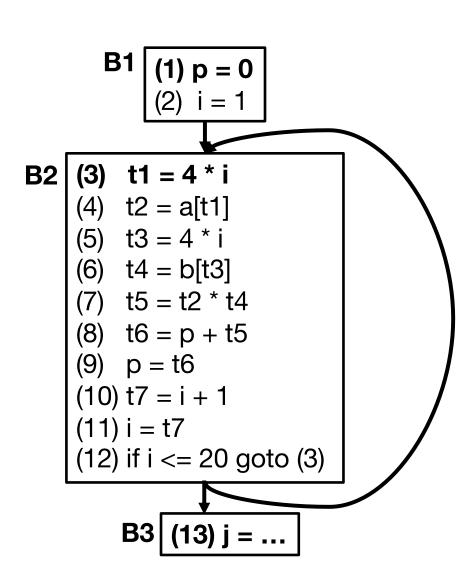

- (1) the first in the program
- (2) any that is the target of a branch
- (3) any that immediately follows a branch

## **Control Flow Graph (CFG)**

- A control flow graph (CFG), or simply a flow graph, is a directed graph in which:
  - (i) the nodes are basic blocks; and
  - (ii) the edges are induced from the possible flow of the program
- The basic block whose leader is the first intermediate language statement is called the entry node
- In a CFG we assume no information about data values
  - an edge in the CFG means that the program may take that path

## **Example: Control Flow Graph Formation**

#### **Dominators**

- A node p in a CFG dominates a node q if every path from the entry node to q goes through p. We say that node p is a dominator of node q
- The dominator set of node q, DOM(q), is formed by all nodes that dominate q
  - Each node dominates itself by definition; thus q ∈ DOM(q)

#### **Dominance Relation**

▶ **Definition:** Let G = (V, E, s) denote a CFG, where

V: set of nodes

E : set of edges

s: entry node and

let  $p \in V$ ,  $q \in V$ 

- p dominates q, written  $p \le q$ 
  - also written p ∈ DOM(q)
- p properly (strictly) dominates q, written p < q if  $p \le q$  and  $p \ne q$
- p immediately (or directly) dominates q, written  $p <_d q$  if p < q and there is no  $t \in V$  such that p < t < q
  - also written p = IDOM(q)

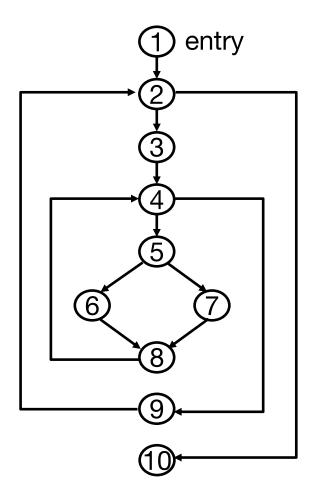

## **Example: Dominance Relation**

#### Dominator sets:

DOM(1) = 
$$\{1\}$$
  
DOM(2) =  $\{1, 2\}$   
DOM(3) =  $\{1, 2, 3\}$   
DOM(10) =  $\{1, 2, 10\}$ 

#### Immediate domination:

$$1 <_d 2, 2 <_d 3, ...$$
  
IDOM(2) = 1, IDOM(3) = 2 ...

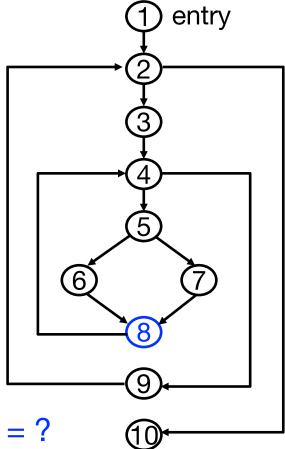

### **Dominance Question**

Assume that node P is an immediate dominator of node Q

Question: Is P necessarily a predecessor of Q in the CFG?

Answer: NO

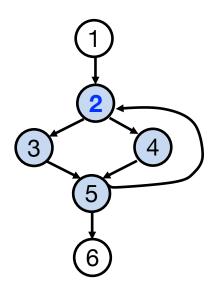

$$IDOM(8) = ?$$

## **Identifying Loops**

- Motivation: Programs spend most of the execution time in loops, therefore there is a larger payoff for optimizations that exploit loop structure
- Goal: Identify loops in a CFG, not sensitive to syntax of the input language
  - Create a uniform treatment for program loops written using different syntactical constructs (e.g., while, for, goto)
- Approach: Use a general approach based on analyzing graphtheoretical properties of the CFG

## **Loop Definition**

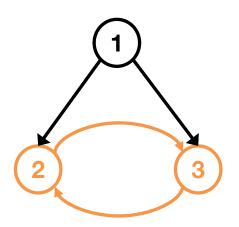

- Definition of a (natural) loop
  - A strongly connected component (SCC) of the CFG, with a single-entry point called the header which dominates all nodes in the SCC

- All nodes in blue form a loop, which is an SCC
- Node 2 is the loop header

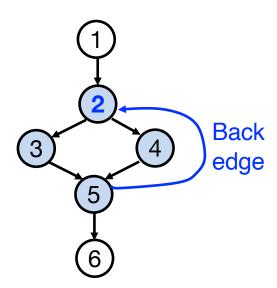

## Is it a Loop?

Question: In the CFG depicted below, do nodes 2 and 3 form an SCC, and if so, do they also form a loop?

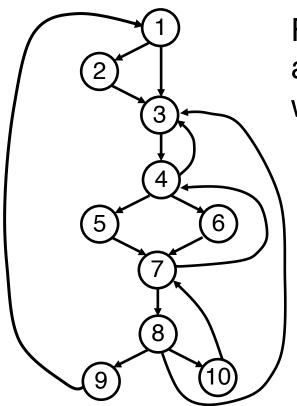

## **Finding Loops**

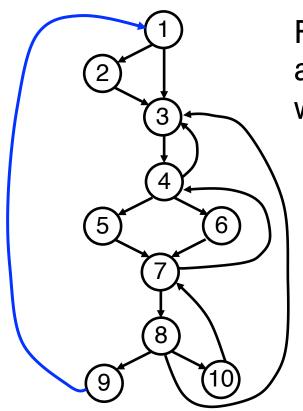

- Loop identification algorithm
  - 1. Find an edge B→H where H dominates B
    - This edge is called a back edge
  - 2. Find all nodes that (1) are dominated by H, and (2) can reach B via nodes dominated by H
  - 3. Add these nodes to the loop (H and B are naturally included)

## **Finding Loops**

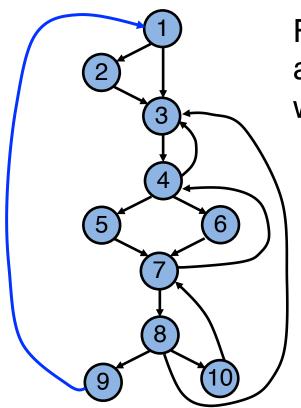

## Finding Loops (1)

Find all back edges in this graph and the natural loop associated with each back edge

(9,1)

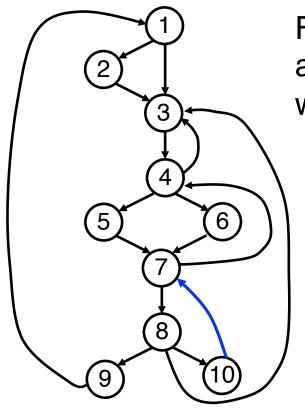

## Finding Loops (1)

Find all back edges in this graph and the natural loop associated with each back edge

(9,1) Entire graph

## Finding Loops (2)

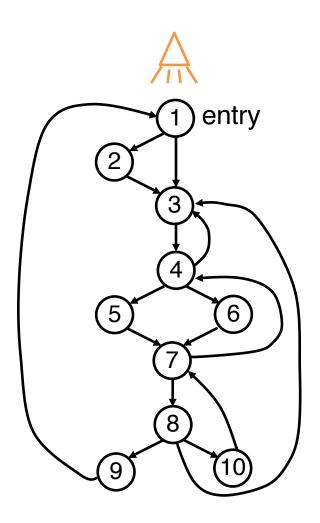

Find all back edges in this graph and the natural loop associated with each back edge

(9,1) Entire graph (10,7)

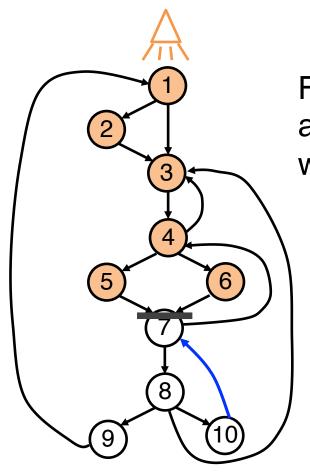

#### **Intuition of Dominance Relation**

Imagine a source of light at the entry node, and that the edges are optical fibers

To find which nodes are dominated by a given node, place an opaque barrier at that node and observe which nodes become dark

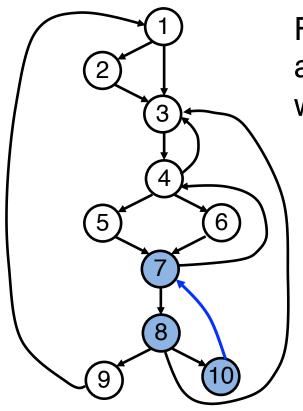

## Finding Loops (2)

Find all back edges in this graph and the natural loop associated with each back edge

(9,1) Entire graph (10,7)

## Finding Loops (2)

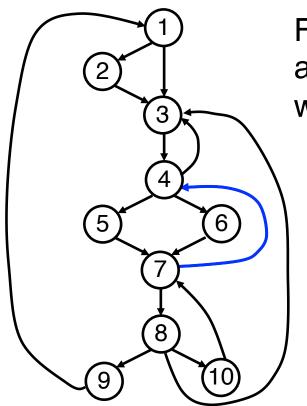

Find all back edges in this graph and the natural loop associated with each back edge

(9,1) Entire graph

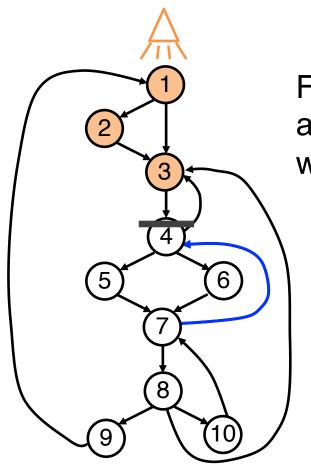

(10,7)  $\{7,8,10\}$ 

## Finding Loops (3)

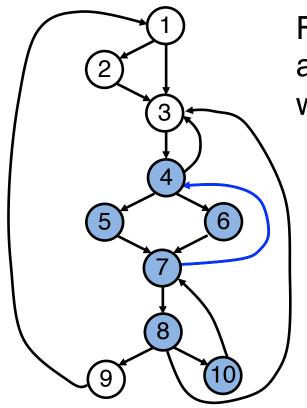

- (9,1) Entire graph
- (10,7)  $\{7,8,10\}$
- (7,4)

## Finding Loops (3)

- (9,1) Entire graph
- (10,7)  $\{7,8,10\}$
- (7,4)

## Finding Loops (3)

- (9,1) Entire graph
- (10,7)  $\{7,8,10\}$
- (7,4)  $\{4,5,6,7,8,10\}$

## **Summary**

- Basic Blocks
  - Group of statements that execute atomically
- Control Flow Graphs
  - Model the control dependences between basic blocks
- Dominance relations
  - Shows control dependences between BBs
  - Used to determine natural loops

## **Next Lecture**

Static single assignment (SSA)
